5	Validation Ledger	6
6	Failure And Limit Ledger	7
7	Authority Boundary	8

Chapter 1

Executive Summary

Key takeaway: S-004.5 hardened the public site after the documentation alignment sprint. It corrected deployment-host leakage, generated dashboard data, runtime metadata, responsive layout defects, legal disclosure placement, CV state behavior, and browser-render validation.

This report backfills a formal PDF from the S-004.5 closure family under [agents/state/logs/S-004.5-site-c](#). It preserves the evidence that the site-quality pass was not only visual polish. It changed artifact hygiene, runtime metadata, generated status data, validation scripts, dashboard behavior, and responsive layout gates.

Chapter 2

Evidence Sources

Table 2.1: S-004.5 evidence map.

Source	Use in this report
agents/state/logs/S-004.5-site-implementation-trace-and-correct	Implementation trace and corrected defects.
agents/state/logs/S-004.5-site-browser-render-validation-evidence	Browser/render validation evidence
agents/state/logs/S-004.5-site-architecture-audit-input	Architecture audit input
agents/state/logs/S-004.5-site-design-system-audit-input	Design system audit input
agents/state/logs/S-004.5-site-interaction-audit-input	Interaction audit input
agents/state/logs/S-004.5-site-dashboard-audit-input	Dashboard audit input
agents/state/logs/S-004.5-site-final-gates-and-closure	Final gates and closure state.

Chapter 3

Corrected Defects

- Removed deployment-host literals from repository source and tightened validation so host values are derived by checks or runtime code.
- Corrected an overbroad placeholder remediation: non-site docs/state use real public URLs, while site metadata/navigation remains runtime-derived.
- Removed a committed static sitemap artifact that could not know the final deployment origin for both root and project-path Pages deployments.
- Converted canonical, Open Graph, Twitter, manifest start URL, and manifest scope behavior to runtime-derived or runtime-relative values.
- Replaced copied dashboard data with generated status export.
- Added dashboard runtime rendering from generated status JSON.
- Reworked the AgenticCareerBoost project page and dashboard route into a status dashboard with workflow, sprint, progress, closure, blocker, source, and evidence sections.
- Adjusted Contact, Projects, dashboard, and CV layouts for desktop and mobile readability.
- Added legal disclosure outside the OS panel/main document.
- Added explicit CV view state classes while preserving pushState filtering.

Chapter 4

Code Areas

Table 4.1: S-004.5 implementation areas.

Area	Change type
Static validator	Required generated public status data, host-literal hygiene, manifest checks, raw pixel restrictions, and deployed artifact hygiene.
Status exporter	Derived public dashboard state from current state, active sprint, and roadmap.
CSS	Centralized tokens and improved dashboard, contact, preview-row, CV grid, and legal-disclosure layouts.
OS JavaScript	Derived site root from script URL, filled runtime metadata, expanded soft navigation, and reloaded dashboard/CV runtime scripts.
CV JavaScript	Used pushState and in-place filtering while marking active controls and visible sections.
Dashboard JavaScript	Fetches generated status JSON and renders dashboard tiles, progress, artifacts, and blockers.

Chapter 5

Validation Ledger

Table 5.1: S-004.5 final gates.

Gate	Status	Evidence
PairCheck-A remediation review	PASS	Closure log.
PairCheck-B remediation review	PASS	Closure log.
Status export	PASS	Closure and implementation logs.
Static validator compile	PASS	Closure log records py-compile.
Static site validation	PASS	Closure log records 17 HTML files and 428 local references.
Pytest	PASS	Closure log records eight tests passing with cache warning only.
Internal links	PASS	Closure log records 126 files and 55 internal references.
Browser/render validation	PASS	Home, Projects, AgenticCareer-Boost, Dashboard, Blog, CV, and Contact at desktop/mobile widths.
Dashboard smoke	PASS	Ready state, no active sprint/idle text, legal disclosure outside main.
Post-review layout correction	PASS	Contact, Projects, CV preview rows, CV selected-work cards, no horizontal overflow.

Chapter 6

Failure And Limit Ledger

- Deployment-host literals were too easy to leak into source, so runtime derivation and validation became necessary.
- Static source files cannot always know final deployment origin across root and project-path Pages deployments.
- Copying dashboard data was rejected in favor of generated status export.
- Render validation found layout defects after static checks had passed; browser checks were therefore essential, not decorative.

Chapter 7

Authority Boundary

S-004.5 is evidence of site-quality hardening. It does not define current rules or sprint scope. Current source has since been migrated under the simplified [agents/](#) and [site/](#) structure; the report preserves why the runtime metadata, generated status, and browser-render gates matter.
