To	Assaia hiring team
Role	Software Engineer – ML Core
Location	Remote, Spain
Date	June 28, 2026

Cover letter

Dear Assaia team,

I am applying for the Software Engineer role because it fits the direction in which I am developing my engineering profile: software around ML systems, pipeline tooling, inference infrastructure, and internal platforms that make model work usable in production.

My background combines Software Engineering studies with ML/AI specialization, backend foundations, REST APIs, SQL, Linux, Git, technical documentation, and repository-based project work. I also bring a previous background in regulated banking and insurance operations, where reliability, traceability, process discipline, data quality, and failure handling were part of daily work.

What interests me most about this role is the bridge between ML research and production software. I am not applying from a pure research profile, but from a software engineering perspective: understanding existing systems, turning technical needs into maintainable tooling, documenting decisions, and building reliable paths between experimental work and operational use.

I use LLM tools as part of my engineering workflow, but with review, structure, and technical judgement rather than as a substitute for understanding the code. That is also how I approach AI systems more broadly: models are valuable components, but production value comes from the surrounding software, data flow, tooling, tests, monitoring, and operational constraints.

I would welcome the opportunity to discuss how my software engineering background, ML/AI direction, and operational discipline could contribute to Assaia’s ML Core team.

Best regards,

Dídac Llorens
