3.4	Interaction And Styling	4
4	Review Inputs	5
5	Validation Ledger	6
6	Deferred Items	7
7	Authority Boundary	8

Chapter 1

Executive Summary

Key takeaway: S-003 simplified the public site from a mixed Intro/Work/Notes/Hire interface into a clearer route map: Home, Projects, Blog, CV, and Contact, with role-specific hire paths retained as utility routes. It translated internal agentic-system language into public project explanations.

This PDF backfills formal documentation from the S-003 closure log at [agents/state/logs/S-003-website-o](#). The work closed locally with route, browser, mobile, image, and soft-navigation checks.

S-003 mattered because the public site had to stop reading like internal system documentation. Project pages needed to explain what each project is, why it was built, how it works, what was learned, and where to inspect source evidence.

Chapter 2

Evidence Sources

Table 2.1: S-003 evidence map.

Source	Use in this report
agents/state/logs/S-003-web-closure-summary/implemented	Closure summary, implemented route map, review inputs, gates, and deferred items.
site/	Public runtime source tree for route, metadata, assets, and CV behavior.
agents/tools/validate_static.py	Current migrated static-site validation surface.
agents/tools/validate_links.py	Current migrated link-validation surface.

Chapter 3

What Changed

3.1 Route Map

The public route model was simplified to:

- Home;
- Projects;
- Blog;
- CV;
- Contact;
- utility hire routes for ML, agentic systems, and backend contexts.

This reduced ambiguity. The old mix of Intro, Work, Notes, and Hire labels made the site feel like an internal navigation experiment. The new route map gave readers obvious public tasks: understand the person, inspect projects, read notes, review a CV, and make contact.

3.2 Project Detail Pages

Project pages moved toward human explanations instead of internal template proof language. The key copy pattern became:

1. what the project is;
2. why it was built;
3. how it works;
4. what was learned;
5. where the source evidence lives.

3.3 Metadata And Data Surfaces

S-003 added or revised public metadata and machine-readable surfaces: [site/manifest.json](#), [site/robots.txt](#), [site/sitemap.xml](#), blog index data, OS index data, and compatibility metadata for notes.

3.4 Interaction And Styling

The monitor visual system was refined with subtler filters, scanlines, and dark corner masking. JavaScript was updated for panel aliases, soft-navigation head sync, and re-entrant CV initialization.

Chapter 4

Review Inputs

Table 4.1: S-003 review viewpoints.

Input	Contribution
Architecture/Journey agent	Route labels, compatibility risks, and user journey clarity.
Content Voice agent	Translation from internal jargon to public copy.
Frontend/Metadata scout	Metadata gaps, responsive navigation risk, monitor mask risk, and validator drift.
WebsiteOS audit input	Crawlability, public translation, and machine-readable surface concerns.

Chapter 5

Validation Ledger

Table 5.1: S-003 closure gates.

Gate	Status	Evidence
Static site validation	PASS	Closure log records static-site validation passing.
Pytest	PASS	Closure log records eight tests passing, with only local cache warning.
Internal links	PASS	Closure log records link validation across 118 files and 49 references.
Browser routes	PASS	Home, Projects, project details, Blog, CV, Contact, and hire route rendered.
Responsive checks	PASS	1440px, 1024px, and 390px checks had no overflow defects.
Soft navigation	PASS	Projects and Blog active state/title sync worked.
CV role switching	PASS	CV role switch worked.
Portrait maximize/minimize	PASS	Interaction validated in browser.

Chapter 6

Deferred Items

- Real blog/article migration from LinkedIn or long-form posts.
- Custom social preview artwork beyond current available assets.
- Full CV visual redesign beyond the current web/PDF behavior.

Chapter 7

Authority Boundary

S-003 explains a public-site clarity pass. It is not the source of current runtime architecture by itself. The live implementation has since been migrated and simplified; current behavior is defined by files under [site/](#) and rules under [agents/rules/](#). This report preserves the historical intent and validation trail.
