## Chapter 1

### Executive Summary

**Key takeaway:** S-004 corrected a strategic drift. The user rejected generic backend/data-quality positioning, and the repository was aligned around a more specific direction: agentic systems, research/applied AI, engineering-heavy ML/data systems, and backend/platform only as a product-company fallback.

This report backfills formal documentation for the S-004 documentation alignment closure at [agents/state/logs/S-004-docs-alignment/closure.md](#). The closure log was written before the later structure simplification, so it contains historical root-level rule/state path names. In the current repository those concepts live under [agents/rules/core/career-direction.md](#) and [agents/state/current.md](#).

The important result did not change: public/career work must not drift into generic backend, BI/reporting, data-quality operations, consulting funnels, or AI-hype positioning.

## Chapter 2

### Trigger

The trigger was a user correction. Previous research and recommendations had started drifting toward backend, data engineering, and data quality. That was not the intended public lane. The repository already contained a stronger strategy: evidence-led agentic systems, formal technical documentation, creative engineering artifacts, and regulated-domain maturity.

## Chapter 3

### Executed Work

Table 3.1: S-004 documentation alignment actions.

| Action                 | Historical closure wording                  | Current migrated meaning                                                                 |
|------------------------|---------------------------------------------|------------------------------------------------------------------------------------------|
| Career guardrail       | legacy root-level career-direction file     | <a href="#">agents/rules/core/career-direction.md</a> blocks generic role drift.         |
| Agent entrypoint       | AGENTS.md                                   | Every role, company, CV, portfolio, and campaign task routes through the guardrail.      |
| README update          | README.md                                   | Repository entrypoint explains the current proof-led direction.                          |
| Social plan correction | content/social/plan.md                      | Relaunch sequence aligns with agentic proof and human-gated publication.                 |
| Human-only queue       | state/human-actions.md                      | <a href="#">agents/state/human-actions.md</a> separates account and publication actions. |
| Relaunch calibration   | state/research/s004-relaunch-calibration.md | Calibration memory preserves role filters and avoidance rules.                           |
| Backlog update         | state/backlog.md                            | <a href="#">agents/state/backlog.md</a> records narrative and technical follow-ups.      |
| State update           | state/active-sprint.md, state/current.md    | Current state records closure while sprint authority stays separate.                     |

## Chapter 4

### Review Results

#### 4.1 Strategy Guardrail

Review pass A returned PASS. It confirmed:

- generic backend drift is blocked;
- data-quality and BI/reporting drift are explicitly rejected;
- agentic systems remain the visible differentiator;
- research/applied AI and engineering-heavy ML/data systems remain valid targeted lanes;
- backend/platform remains a product-company fallback, not the primary identity.

#### 4.2 Scope And Human Gates

Review pass B returned PASS. It confirmed that no website files were modified, website implementation stayed assigned elsewhere, publication remained human-gated, account-owned LinkedIn/GitHub changes stayed human-gated, and no destructive repository actions were executed.

#### 4.3 Documentation Hygiene

Review pass C returned PASS. It confirmed the README, agent endpoint, human task queue, backlog, and table hygiene were aligned enough to close the sprint.

## Chapter 5

### Closure Matrix

Table 5.1: S-004 closure state.

| Dimension                        | State      | Evidence                                                                                                    |
|----------------------------------|------------|-------------------------------------------------------------------------------------------------------------|
| Repository artifacts             | done       | Guardrail, AGENTS entrypoint, README, social plan, human actions, research calibration, backlog, and state. |
| Website scope                    | excluded   | The closure explicitly excluded site edits.                                                                 |
| Public-narrative decision        | done       | Relaunch correction recorded and generic drift blocked.                                                     |
| Formal engineering documentation | backfilled | This report fills the formal PDF gap later.                                                                 |
| Technical backlog                | done       | Follow-ups recorded.                                                                                        |
| Narrative backlog                | done       | Follow-ups recorded.                                                                                        |

## Chapter 6

# Human-Required Tasks

The closure centralized human-owned tasks:

1. confirm LinkedIn headline, About, and Featured alignment;
2. confirm GitHub account metadata and pinned repositories;
3. remove or neutralize legacy public surfaces;
4. approve the first LinkedIn posts;
5. select the first company outreach batch using the career guardrail.

## Chapter 7

# Authority Boundary

**Key takeaway:** S-004 is the reason the current campaign guardrail exists. It is not a free-standing instruction source; the current rule file is the authority.

The behavior rule now lives in [agents/rules/core/career-direction.md](#). This report documents why that rule exists and how the correction happened. If report text and rules ever conflict, [agents/rules/](#) wins.
